

# A CHECKLIST OF THE FLORA OF STAFFORDSHIRE

## Fully Revised 2021

The first checklist for the county was prepared by Ian Hopkins:

Hopkins, I.J. (1985) ***Staffordshire Flowering Plants and Ferns***. Stoke-on-Trent City Museum and Art Gallery.

He used information from E.S. Edees' ***Flora of Staffordshire*** (1972; David & Charles) as a basis for frequency assessment with some changes where additional/more recent data suggested it was necessary. 800 tetrads were involved.

Work on John E. Hawksford & Ian J. Hopkins' ***The Flora of Staffordshire*** (2011; Staffordshire Wildlife Trust) commenced in 1998, with contributions from many botanists. Species accounts and distribution maps were completed in December 2010. The number of tetrads in which each taxon occurred within the period post-1994 was ascertained and its frequency assessed.

The earlier checklist employed six frequency categories and this method is adopted here. However, the more recent *Flora* covers a larger geographical area than the earlier one. It includes all areas that have, at any stage, been included in administrative Staffordshire as well as the botanical vice-county (VC 39): all or part of 885 tetrads. Consequently, the upper limit of each category boundary has been raised by 10%:

Very Common	649 - 885 tetrads
Common	275 - 648 tetrads
Frequent	110 - 274 tetrads
Uncommon	39 - 109 tetrads
Rare	9 - 38 tetrads
Very Rare	1 - 8 tetrads

Some sub-specific taxa have been under-recorded by some botanists and the same is certainly true within critical groups. Where the compiler is convinced in his own mind that the true frequency of occurrence would almost certainly move the frequency into the category above that corresponding to the actually recorded figure, a \* is added. Thus: "Dryopteris affinis ssp. affinis....Rare\*" indicates that many of the records for Scaly Male Fern were not determined to subspecific level and that, if they had, the frequency level of this ssp. would almost certainly be raised to "Uncommon".

Although D.P. Earl has kindly provided many *Rubus* records, these were only from the north of the county. Those species which are extremely likely to be frequent enough further south to raise the frequency category are marked "‡".

Given the little recording done by other botanists, the categories given cannot be relied upon.

The frequency of *Salix x sepulcralis* is given as "Rare†". It is almost certainly "Uncommon", having often been incorrectly recorded as "*S. babylonica*", which has not recently been confirmed for the county.

Recent work on *Hieracium acuminatum* indicates that it was previously largely misidentified. It may well be very rare, or even absent from Staffordshire, rather than frequent. It is designated "Frequent¥". On the other hand, it is extremely likely that *Epilobium palustre* has been over-recorded at the expense of other *Epilobium* spp and is not, in fact, frequent in Staffordshire. It is accordingly marked "¢".

The list order and the English names for *Rubus* species are those of **Sell & Murrell's Flora of Great Britain & Ireland** volume 2. The same applies to volume 4 and the list for *Hieracium* and the two for *Taraxacum* species.

*Hyacinthoides hispanica* has been recorded for 90 tetrads in the county. All, or nearly all, of these records are likely to be errors for *H. x massartiana* and it is therefore listed as very rare, rather than uncommon,

A date is given for the last sighting of a taxon when this was between 1976 and 2000. Any taxon only seen before 1976 is regarded as extinct and is omitted.

An "Archaeophyte" is a taxon, not native to the British Isles, that was introduced prior to the year 1500.

A "Neophyte" is a taxon, not native to the British Isles, that was introduced after the year 1500.

The revised list follows the taxonomic order of genera in the **Fourth Edition of New Flora Of The British Isles:** Clive Stace (2019); Cambridge; and incorporates its name changes. In addition, Charophytes and taxa first recorded in the years 2012 to 2020 or reported for the first time in the **Flora of Birmingham & the Black Country** are included.

All records made during the preparatiuon of the BSBI's **Atlas 2020** Project and in subsequent months have also been incorporated. This has resulted in many modifications to the previous list.

The 2011 Staffordshire *Flora* contains full acknowledgements of those organisations (including Staffordshire Ecological Record, Staffordshire Wildlife Trust and EcoRecord) and the many individual botanists on whose records the volume is based.

I am very grateful to Ian Hopkins for his advice during the preparation of the Checklist.
